

Day 4: Other Protocols in Action Theory

Task 1 :- Install FileZilla Server on your Windows machine, create a user account, and set up a shared folder for FTP access.

ANS :-

1.Install FileZilla Server :

Download FileZilla Server from the official site, run the .exe installer, and click Next through default settings.

2.Create user account :

Open FileZilla Server interface, go to Server > Configure > Users.

Click Add, type a username, and set a password under Credentials.

3.Set up shared folder :

Under Mount points :

1. Click Add.
2. Set Virtual path to /.

3. Set Native path to your folder (e.g., C:\ftp_share).
4. Set Access mode to Read + Write, then click OK.

Task 2 :- Use FileZilla Client to connect to your FTP server using the credentials you created, and upload any image file from your computer to the shared folder.

ANS :-

1.Connect to server :

Open FileZilla Client, enter these details at the top bar, and click Quickconnect :

- Host: 127.0.0.1 (or your server IP)
- Username : your username
- Password : your password
- Port: 21

2.Upload image file :

1. On the left box (Local site), locate your image file.
2. Right-click the image and select Upload (or drag it to the right box).

3.Verify upload:

Check the right box (Remote site) to confirm your image file is listed in the folder.

Task 3 :- Download the uploaded file from your FTP server to a different folder on your computer using FileZilla Client, and verify the file size matches the original.

ANS :-

1.Select local destination folder:

On the left box (Local site), navigate to a different folder on your computer (e.g., Downloads).

2.Download the file:

On the right box (Remote site), right-click your uploaded image and select Download (or drag it to the left panel).

3.Compare file sizes:

Check the Filesize column in FileZilla for both files, or right-click each file in Windows Explorer > Properties to confirm the byte count matches exactly.

Task 4 :- Research and list 3 real-world scenarios where SNMP is used in network management for apps or services you use (such as ISPs, campus WiFi, or large websites).

ANS :-

Campus Wi-Fi (Connected Users & Access Points) :-

- Use: University IT uses SNMP to track how many students are connected to each Wi-Fi router.
- Why: If an Access Point gets overloaded or dies, SNMP immediately alerts IT to rebalance the load.

ISPs (Bandwidth & Speed Usage) :-

- Use: Internet Service Providers use SNMP to track data traffic on major fiber routers.
- Why: It checks total download/upload speeds in real time to prevent network slowdowns and detect line failures.

Data Centers & Websites (Server Health) :-

- Use: Big sites (like Netflix or Amazon) use SNMP to monitor server CPU usage, temperature, and memory.
- Why: If a server gets too hot or runs out of RAM, SNMP sends an automated alert before the site crashes.

Task 5 :- Create a table comparing FTP and HTTP across at least 5 points: port number, security, data transfer method, use cases, and authentication.

ANS :-

Feature	FTP	HTTP
Port Number	Uses Port 21 for commands and Port 20 for data.	Uses Port 80 (or 443 for secure HTTPS).
Security	Plain text (unencrypted); passwords and data are sent exposed.	Plain text, but easily secured via HTTPS (SSL/TLS).
Data Transfer	Uses two separate connections (one for control, one for data).	Uses one single connection for requests and responses.
Use Cases	Uploading/downloading large files and server management.	Loading web pages, text, images, and streaming web content.
Authentication	Mandatory; requires a username and password to log in.	Optional; most websites are publicly accessible.
